

## VALUE LAB | A THEORY FOR YOUR FIRM

#### FIGURE 1

THEORY ACTIONS

**Beliefs** Run Experiments Core Problem Common Subproblems Shop for Investments Contrarian or Uncommon Causal Logic (expressed as if-then statements or hypotheses) IF Search for Solutions THEN

## WHAT YOUR THEORY OF VALUE PROVIDES

- A vehicle for composing testable hypotheses
- A vehicle for engaging in "costless" thought experiments
- A vehicle for specifying real experiments to run and data to collect
- A vehicle to structure the search for subproblem solutions
- A logical architecture for interpreting the results of your experiments

#### **A THEORY**

Belief

#### Problem

Sub Problems

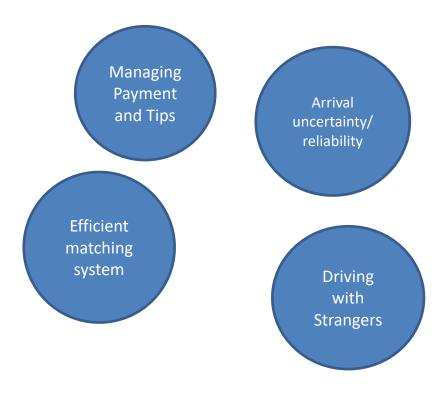

There is vast reservoir of personal vehicles (and drivers) which could satisfy the unmet demand for taxi service

How do we provide fast, reliable taxi service, especially at times when taxis are difficult to secure?

#### Theory (in words)

If we can efficiently connect drivers to riders, enable riders to feel confident in the timeliness of service, and both riders and drivers to feel safe, then we can tap this vase reservoir of personal vehicles to address unmet taxi demand.

### **A THEORY**

Belief

Problem

Sub Problems

How do we make personal computers that are easy to use and reliable?

Computers can be a useful product for the masses

Theory (in words)

If we can make personal computers easy to use and reliable, then masses of consumers will purchase and purchase at a premium price.

Clumsy, nonintuitive OS

Integrating peripherals and new software

Mismatch between screen and printed output

> Reliability/ system stability

## **HOW DO I EFFICIENTLY TEST A THEORY?**

- Key principle: (Maximize learning; Minimize Cost)
  - Experiment first where you can learn the most with the lowest investment
  - Experiment to test first the weakest assumptions those which if false would negate entire theory
  - Search first for solutions to most critical subproblems—those which if unsolved would negate entire theory
  - Conserve on resources

## THE MINIMUM VIABLE PRODUCT (MVP) **PROBLEM**

- What happens when the cost of testing the full solution (the MVP) is exorbitant?
- Option 1: solve easily tested problems
- Option 2: theory-based learning, search, and experimentation

"I'm searching for my keys."

# A ROADMAP OF TESTS, EXPERIMENTS, RESOURCES TO FIND

- Will customers ride with strangers in private cars?
  - What experiment can we run?
- Can we compose an efficient matching app?
  - What analogous apps already exist?
- Can we facilitate confident, safe payment?
  - What existing technology already exists?
- Can we ensure and motivate quality?
  - What existing rating systems are there? Are there two sided rating systems?

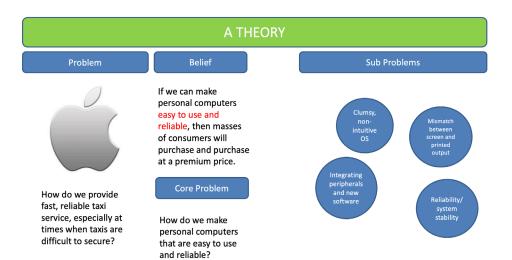

# EVIDENCE IN SUPPORT OF THEORY-BASED LEARNING

- Randomized control trial involving hundreds of startups in Italy and UK, based on the Value Lab:
  - one group received standard startup training; other group pushed to develop theory by pushing beliefs into testable hypotheses.
- Results: Those trained to start with a theory were (relative to the control group):
  - more likely to develop clear theories and hypotheses, and to develop targeted experiments to test them.
  - more likely to pivot
  - more likely to exit (quickly)
  - more likely to develop a valuable business model

#### FIGURE 2

## THEORY ACTIONS

#### **Beliefs**

#### Common

What are the deeply held orthodoxies and beliefs in the industry about technology, consumer tastes, production, distribution, governance and so forth?

#### Contrarian or Uncommon

What do you believe that others don't? Can you imagine beliefs that are contrarian to the industries common beliefs? How might you think differently about how to organize, the future of technology, consumer demand?

#### Core Problem

What core problem prevents the realization of your uncommon belief?

#### Subproblems

What three to five key subproblems must be solved to solve your core problem?

#### Causal Logic

(expressed as if-then statements or hypotheses)

IF Attempt to capture your central hypothesis in an if-then statement of the following form: if we solve these

form: if we solve these subproblems, then we solve this core problem that enables us to introduce the following value.

#### **Run Experiments**

What experiments would test the central tenets of the theory? What must we prove to be true?

#### Shop for Investments

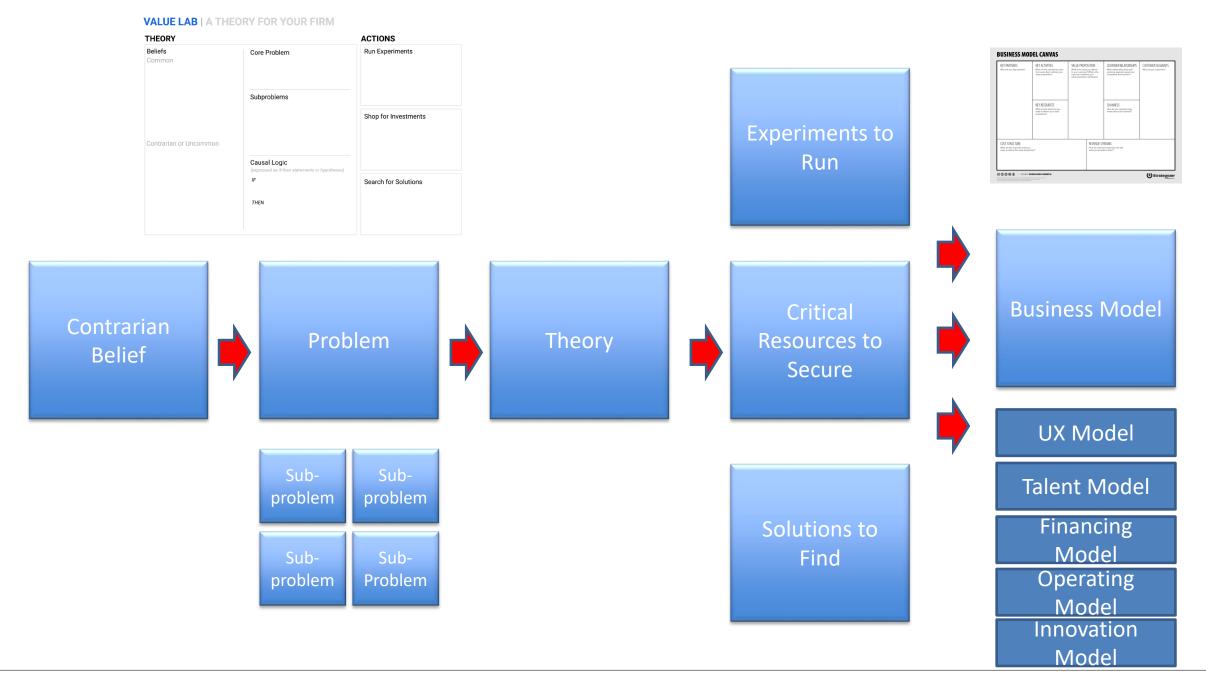

What assets, technologies, and skill sets does the theory reveal as currently undervalued?

#### Search for Solutions

Where can we search for solutions to subproblems? Who has solved closely related problems already (perhaps in a different industry)?

# Entrepreneurial Experiments and Action Steps

Hypotheses or Assumptions to Test and How	Key subproblems to solve and where to search	Critical resources to secure and likely location

## **KEY QUESTIONS**

- What critical information would I like to possess?
- What are my critical assumptions?
- What do I wish I knew?
- What information might cause me to pivot to a different business model?
- What are the critical hypotheses or assumptions that need to be tested?

## **BREAKOUT ASSIGNMENT**

 Develop a preliminary plan that spells out experiments you need to run, data you need to gather, and solutions you need to search for (and where to search).

## **APPLICATION VIDEO**
